## PREFACE.

The extended calculations required by some of the applications of trigonometry, are laborious even to experienced computers; to beginners they are often a fruitful source of discouragement. Experience in making calculations and familiarity with the formulas employed will suggest those methods of arrangement by which skillful computers shorten their work and save much of their time. It should always be the aim, to secure the results to the degree of accuracy required, by a minimum expenditure of time and labor. So far as the mechanical part of the work is concerned, the principal factors leading to this end, are, the proper arrangement of the formulas to be used before the computation is begun, the use of conveniently arranged tables, containing needed helps for facilitating interpolation, and the use of no more places of decimals than are necessary to secure the desired accuracy in the results.

Orderly arrangement is almost indispensable to correct and rapid computation, and, consequently, the practice of making computations on loose scraps of paper, without systematic arrangement, should not be followed. In the beginning an outline of the entire solution should be made by writing the symbols of the quantities to be used in a vertical column. Those which are to be combined, as shown by the formulas, should be placed adjacent. In the same solution, turning more than once to the same place in the tables should be avoided. This can be done by taking from the tables at one opening, all the functions of a given angle, which are required in the solution, and, writing them in their proper places.

The logarithmic and other tables employed should be conveniently arranged. They should contain the auxiliary tables of proportional parts on the margins of the pages, excepting where the differences are so small that the interpolations can easily be made mentally without them.

The number of places of decimals to be used in any computation, will depend upon character of the data employed and also upon the degree of accuracy required in the results. Where the data are given with great precision and the results to be derived from them, are required with extreme accuracy, tables to seven and in rare cases even to ten or more places of decimals must be used. But for nearly all ordinary calculations such precision is not required, and the accuracy of the results obtained by the use of logarithms to five places of decimals, is amply sufficient. The use of this number affords results which are usually correct to one ten-thousandth part. In calculations where this degree of accuracy is not required, a smaller number of places of decimals should be used. In such cases it is frequently more convenient to use natural numbers and the natural trigonometric functions instead of their logarithms.

In compiling this book of tables for general use, the needs of students and of computers have been kept in view. In selecting the arrangements of the tables, those have been taken which experienced computers find most convenient. They are, at the same time, those which are best adapted to the needs of students. The book contains a large number of useful tables, and, it is believed, that all needed helps are given for facilitating interpolation. For this purpose auxiliary tables of proportional parts are given on the margins of the pages throughout the logarithmic portions of the book. In general, the differences in the table of the natural trigonometric functions are so small, that the interpolations can easily be made without the use of the tables of proportional parts. They are, therefore, omitted in this table and also in the table of squares, etc., where interpolations are seldom necessary.

Throughout the greater part of the book, every tenth number is enclosed by parallel lines and a space is left between every three numbers. This is for the purpose of giving the pages a pleasing appearance and of enabling the values to be readily found. In the trigonometric tables, it has been the aim to secure a symmetrical arrangement, so that in reading from the bottom of the page, the order is the same as that from the top.

The auxiliaries *S* and *T* are given at the bottoms of the pages in the table of the logarithms of numbers. They are always used in connection with the logarithms of numbers, and, consequently, this arrangement is more convenient than having them in a separate table. Their arithmetical complements *C S* and *C T* are given in the table of the logarithms of the trigonometric functions.

The tables of addition and subtraction logarithms are based on those of Zech. The argument is always obtained by subtracting the smaller from the larger logarithm. In addition the function is always added, and in subtraction it is always subtracted from the larger logarithm. On account of these uniform ways of proceeding, these tables are more convenient than the usual Gaussian tables.

Great care has been taken to secure accuracy in the tables. The proofs have been read very carefully. Excepting in the introduction and in the table of constants, only four errors have been detected in the first edition. The correct values of the mantissae of the logarithms of 5360 and 5489 are .72916 and .73949; the square of 881 is 776161; the cube root of 1008 is 10.0266. All known errors of the first edition have been corrected in this one.

Acknowledgment is due to Mr. Taka Kawada, student in the University, for much careful assistance in reading the proofs of both editions, and to Professor W. W. Campbell, Astronomer in the Lick Observatory, for valuable suggestions and for permission to use the collection of formulas resulting from the method of least squares, contained in his *Practical Astronomy*.

## INTRODUCTION.

---

Logarithms are used in lengthy numerical calculations to diminish the labor of multiplication, division, involution and evolution, by respectively substituting for them the operations of addition, subtraction, multiplication and division.

The rules for their use are as follows:

*The logarithm of a product is equal to the sum of the logarithms of its factors.*

*The logarithm of a quotient is equal to the logarithm of the dividend, minus the logarithm of the divisor.*

*The logarithm of any power of a number is equal to the logarithm of the number multiplied by the index of the power.*

*The logarithm of any root of a number is equal to the logarithm of the number divided by the index of the root.*

Or, expressed in formulas,

$$\log A \times B = \log A + \log B, \quad \log \frac{A}{B} = \log A - \log B,$$

$$\log A^n = n \log A, \quad \log \sqrt[n]{A} = \frac{\log A}{n}.$$

These rules are true for all systems of logarithms. The *Common Logarithms* are the only ones used in numerical calculations and in the following pages they are always meant unless the contrary is stated.

*The common logarithm of a given number is the index of that power of 10 which is equal to the number.* Thus, 2 is the logarithm of 100, because  $10^2 = 100$ ; this equation is usually written  $\log 100 = 2$ . 10 is the *base* of the system. A *system of logarithms* comprises the logarithms of all positive numbers to a given *base*.

From the definition of common logarithms it follows, that

$\log 1 = 0,$	$\log 0.1 = -1,$
$\log 10 = +1,$	$\log 0.01 = -2,$
$\log 100 = +2,$	$\log 0.001 = -3,$
$\log 1000 = +3,$	$\log 0.0001 = -4,$
etc.,	etc.,

from which it is evident, that logarithms are, in general, not integers. Thus, the logarithm of a number between

0.01 and	0.1	is	$-2 + \text{a fraction},$
0.1 and	1	is	$-1 + \text{a fraction},$
1 and	10	is	$0 + \text{a fraction},$
10 and	100	is	$1 + \text{a fraction},$
100 and	1000	is	$2 + \text{a fraction}.$

The fractional part of a logarithm is usually expressed decimally and is so taken as to be positive. It is then called the *mantissa*, and the integral part is called the *characteristic*.

Changing the decimal point in a number is equivalent to multiplying or dividing it by an integral power of 10; consequently, the logarithms of numbers which are the same, excepting the position of the decimal point, differ by integers. Thus the logarithm of 389.4 is 2.59040, and since  $38940 = 100 \times 389.4$ , the first rule for the use of logarithms gives

$$\begin{aligned}\log 38940 &= \log 100 + \log 389.4 \\ &= 2 + 2.59040 = 4.59040.\end{aligned}$$

Similarly,

$$\begin{aligned}\log 3.8940 &= \log .01 + \log 389.4 \\ &= -2 + 2.59040 = 0.59040.\end{aligned}$$

Hence,

*The mantissae of the logarithms of all numbers composed of the same figures in the same order, are the same.*

The value of the characteristic depends upon the position of the decimal point in the number. An inspection of the above table shows, that

*The characteristic of the logarithm of a number, partly or wholly integral, is zero or positive, and one less than the number of figures in the integral portion;*

*The characteristic of the logarithm of a pure decimal is negative, and one more than the number of ciphers preceding the first significant figure.*

Examples: The mantissae of the logarithms of 349600, 3496, 3.496, .003496 are the same, being .54357; their characteristics are +5, +3, 0 and -3, respectively. Thus,  $\log .003496 = \bar{3}.54357$ , the minus sign being placed over the characteristic to indicate that it only is negative.

The rule given above for determining the characteristic of the logarithm of a pure decimal is strictly correct, and so also is the manner of writing the negative characteristic. In computing, however, it is not desirable to use the characteristics in the manner indicated. It is preferable to add 10 to logarithms having negative characteristics and to allow for the increase by a proper interpretation of the results. When so increased the characteristics may, in all operations, except in some cases in the extraction of roots, be treated as if they were positive. When written in this manner, the rule for their determination is as follows:

*The characteristic of the logarithm of a pure decimal is 9, diminished by the number of ciphers preceding the first significant figure.*

Examples: The characteristics of the logarithms of .8437, .02804, .000105 and .000009207 are respectively 9, 8, 6 and 4.

The logarithmic trigonometric functions, and the logarithms of constants less than unity contained in these tables, have had their characteristics increased by 10.

In finding the logarithm of a root an apparent difficulty arises when the characteristic is negative and is not a multiple of the index of the root. The difficulty disappears by increasing the characteristic negatively by the smallest number which will make it such a multiple and by increasing the mantissa positively by the same number. Thus, the logarithm of .003392 is 3.53046. The logarithm of its square root is obtained by writing its logarithm in the form  $-4 + 1.53046$  and dividing by 2, the index of the root. This gives  $-2 + .76523$ , or  $\bar{2}.76523$ , or 8.76523.

A better way of proceeding is to add 10 times the index of the root to the logarithm and then divide by the index of the root. Thus, in the example given, adding 20 to the logarithm of .003392 and dividing by 2, gives 8.76523, which is the logarithm of the square root. By adding 30 and dividing by 3, the logarithm of the cube root is obtained. The logarithm of the cube root of .003392 is 9.17682.

The *arithmetical complement* of a logarithm is the difference obtained by subtracting it from 0, or from 10, if it is desired to avoid negative characteristics.

It is easily obtained by subtracting each figure of the logarithm, except the last significant one, from 9; the last significant figure must be subtracted from 10. Thus,  $\log 2763 = 3.44138$ , and its arithmetical complement is 6.55862. It is to be noticed, that the logarithm of the reciprocal of a number, is the arithmetical complement of the logarithm of the number; for example,  $\log \frac{1}{2763} = 6.55862$ .

Since the sine and cosecant, cosine and secant, tangent and cotangent are reciprocals, their logarithms are arithmetical complements. Thus,  $\log \sin 22^\circ 18' 24'' = 9.57928$ , and  $\log \operatorname{cosec} 22^\circ 18' 24'' = 0.42072$ ;  $\log \cos 22^\circ 18' 24'' = 9.96622$ , and  $\log \sec 22^\circ 18' 24'' = 0.03378$ ;  $\log \tan 22^\circ 18' 24'' = 9.61306$ , and  $\log \cot 22^\circ 18' 24'' = 0.38694$ .

A dash printed over a terminal 5 indicates that the true value is less than 5. For example the logarithm of 59903 to seven decimal places is 4.7774486; to five decimal places this is written 4.77745. If only four decimal places are required in a computation, the  $\bar{5}$  is neglected. Thus, the above logarithm is written 4.7774.

When a dash is not printed over a terminal 5, and only four decimal places are required, the fourth decimal figure is increased by one and the 5 neglected. For example, the logarithm of 7671 to five decimal places is 3.88485; to four decimal places this is written 3.8849.

## TABLE I

Pages 2-3 contain the mantissae of the logarithms of all numbers of one, two and three figures; the characteristics are determined by the rules previously given. If the number has one or two figures, it is given in the first column, headed N, and the mantissa of its logarithm is directly opposite it in the second column, headed L. Thus,  $\log 3 = 0.47712$ ,  $\log 24 = 1.38021$ ,  $\log .067 = 8.82607$ . If the number has three figures, the first two are given in the first column and the third in the horizontal row at the top or bottom of the page, and the mantissa of its logarithm is at the intersection of the line containing the first two figures and the column containing the third. Thus,  $\log 184 = 2.26482$ ,  $\log 89.1 = 1.94988$ ,  $\log 9.37 = 0.97174$ .

Pages 4-21 contain the mantissae of the logarithms of numbers from 100 to 10009. The arrangement is similar to that just described. The first three figures of the number are given in the first column and the fourth in the horizontal row at the top or bottom of the page. The last three figures of the mantissae are given in the columns headed 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and the first two, at intervals, in the second column under L. When the first two are not given in any line, they are to be taken from the first line above containing them, except, when the last three are preceded by a \*, in which case they are to be taken from the next line. Thus, (p. 13)  $\log 5764 = 3.76072$ ,  $\log 58.35 = 1.76604$ ,  $\log .5889 = 9.77004$ .

When the number has more than four figures, its logarithm is found by *interpolation*. For small differences, it is assumed, that differences between numbers are proportional to the differences between their logarithms. For example, required the logarithm of 168.342. The number has three orders of integers, hence the characteristic is 2. Disregarding the decimal point, the number is 168342. The round numbers, having four significant figures, next smaller and next greater than this, are 168300 and 168400, and their mantissae are (p. 5) .22608 and .22634. These numbers differ by 100, their mantissae, by 26. 26, being the difference between two successive values in the table, is the *tabular difference*. 168342 is 42 greater than 168300, hence its mantissa is  $\frac{42}{100}$  of 26 (= 11, to the nearest integer,) greater than that of 168300. Therefore,  $\log 168.342 = 2.22619$ . Similarly,  $\log 39.6427 = 1.59816$ .

To facilitate interpolation, the tenths of the *tabular differences* are given under P P, (*proportional parts*). Thus, from the proportional table for 26, (p. 5),

the proportional part for 4 = 10.4

10        "        "        "        2 = .52

Therefore,        "        "        "        42 = 10.92,

or 11, to the nearest integer, which agrees with the value above.

By reversing these operations, the number corresponding to a given logarithm may be found. For example, find the number of which 1.47384 is the logarithm. The next smaller mantissa (p. 7) is .47378. It corresponds to the number 2977. The difference between it and the next greater mantissa, .47392, is 14, while the difference between it and the given mantissa is 6. The figures following 2977 are obtained by dividing 6 by 14, giving 43. Hence, the number is 29.7743. The interpolation is facilitated by using the proportional table for 14. In it, 5.6 is the value next smaller than the given difference 6; 4, the fifth figure of the number, corresponds to 5.6. The difference between 6 and 5.6 is .4, which becomes 4.0 by removing the decimal point one place to the right. Corresponding to 4.0, the nearest value is 3, this is the sixth figure of the number. The interpolations, where proportional parts are given, should be made mentally, the results only being written.

The logarithmic sines and tangents of small angles may be found by means of the values of S and T, given at the bottoms of the pages. The formulas for their use are as follows:

$$\log \sin = \log \text{arc} + S,$$

$$\log \tan = \log \text{arc} + T,$$

the angle being expressed in seconds of arc. The value of S or T, to be used in any case, is that which corresponds to the angle.

*Example 1.* Find  $\log \sin 3''.4785$ .

$$\log 3.4785 = 0.54139 \quad \text{p. 8.}$$

$$S = 4.68557 \quad \text{p. 2.}$$

$$\log \sin 3''.4785 = 5.22696.$$

*Example 2.* Find  $\log \tan 1^\circ 14' 17''.84 = \log \tan 4457''.84$ .

$$\log 4457''.84 = 3.64912 \quad \text{p. 10.}$$

$$T = 4.68564 \quad \text{p. 10.}$$

$$\log \tan 1^\circ 14' 17''.84 = 8.33476.$$

#### TABLE II.

When the logarithms of two numbers are given and the logarithm of their sum or difference is required, it may be found by using the addition or subtraction table. The equations at the bottoms of the pages, 24–36 inclusive, indicate the manner of using these tables. In interpolating, it is to be noticed that the function B decreases as the argument A increases; consequently, the proportional parts must be subtracted instead of added.

*Example 1.* Given,  $\log a = 0.98519$  and  $\log b = 0.64834$ . Required  $\log (a + b)$ .

$$\log a = 0.98519$$

$$\log b = 0.64834$$

$$A = \log a - \log b = 0.33685$$

$$B = 0.16448 \quad \text{p. 24.}$$

$$\log (a + b) = \log a + B = 1.14967.$$

In this case the tabular difference is 31, the proportional table for 31 gives 26 as the proportional part corresponding to 85, the last two figures of A; subtracting

26 from 0.16474, the value of  $B$  in the table corresponding to a value of  $A = 0.33600$ , gives 0.16448. This is the value of  $B$  corresponding to  $A = 0.33685$ .

*Example 2.* Given,  $\log a$  and  $\log b$ , as in Example 1. Required  $\log(a - b)$ .

In this case  $x = \log a - \log b$  is  $>.3$ , and, as above,

$$A = \log a - \log b = 0.33685$$

$$B = 0.26794 \quad \text{p. 29.}$$

$$\log(a - b) = \log a - B = 0.71725.$$

*Example 3.* Given,  $\log a = 0.74346$  and  $\log b = 0.59484$ . Required  $\log(a - b)$ .

In this case  $x = \log a - \log b$  is  $<.3$ , and

$$B = \log a - \log b = 0.14862$$

$$A = 0.53790 \quad \text{p. 33.}$$

$$\log(a - b) = \log a - A = 0.20556.$$

### TABLES III AND IV.

These tables, pp. 37-106, contain the logarithms of the trigonometric functions. The headings of the pages and columns indicate what they contain. The degrees are given at the tops, and bottoms, of the pages. On pp. 37-49, the minutes and each ten seconds are given in columns at the left and right, headed ' ', and the odd seconds are given in a horizontal row at the top and bottom of each page. On pp. 50-106, the minutes are given in columns at the left and right, headed ' '; and on pp. 50-60, each ten seconds is given in a horizontal row at the top and bottom of each page. The columns of minutes on the left read downward; the horizontal rows at the top, from left to right; these go with the degrees at the tops of the pages. The columns of minutes at the right and the horizontal rows at the bottom, read in the opposite directions, and go with the degrees at the bottoms of the pages. On pp. 62-106, the *tabular differences* of the logarithmic sines and cosines are given in the columns headed  $d$  (*difference*), and those of the logarithmic tangents and cotangents in the columns headed  $c d$  (*common difference*).

*Example 1.* Find  $\log \sin 0^\circ 37' 24''.37$ .

Page 44.  $\log \sin 0^\circ 37' 24'' = 8.03659$  Tabular difference = 19.

proportional part for 3 = 5.7

$\frac{1}{10}$  " " " 7 = 1.33

$$\log \sin 0^\circ 37' 24''.37 = 8.03666.$$

The tabular difference is 19 and the proportional table for 19 (p. 45), is used to facilitate the interpolation. The tabular difference is obtained by subtracting  $\log \sin 0^\circ 37' 24' = 8.03659$  from  $\log \sin 0^\circ 37' 25'' = 8.03678$ . In performing this subtraction, only the final figures of the logarithms need be used. Thus, in this case, subtract 59 from 78. The interpolation should be made mentally and only the final result written.

*Example 2.* Find  $\log \tan 0^\circ 42' 17''.48$ .

Page 47.  $\log \tan 0^\circ 42' 17'' = 8.08992$  Tabular difference = 17.

proportional part for .48 = 8.16

$$\log \tan 0^\circ 42' 17''.48 = 8.09000.$$

*Example 3.* Find  $\log \cos 0^\circ 57' 19''$ .

This is given without interpolation in the first column of page 48, the first figures being given at the top of the column. The value is 9.99994.

*Example 4.* Find  $\log \cos 89^\circ 43' 26''.4$ .

Page 40.  $\log \cos 89^\circ 43' 26'' = 7.68296$  Tabular difference = 44.

proportional part for 4 = 17.6

$$\log \cos 89^\circ 43' 26''.4 = 7.68278.$$

The proportional part is subtracted, because the cosine, here, decreases as the angle increases.

*Example 5.* Find  $\log \sin 3^\circ 27' 44''.6$ .

Page 54.  $\log \sin 3^\circ 27' 40'' = 8.78083$  Tabular difference = 35.

 $\frac{1}{10}$  " " " 6 = 2.1  
 $\log \sin 3^\circ 27' 44''.6 = 8.78099.$

Also from pages 54 and 55,

$\log \cos 3^\circ 27' 44''.6 = 9.99920.$   
 $\log \tan 3^\circ 27' 44''.6 = 8.78178.$

*Example 6.* Find  $\log \tan 8^\circ 33' 17''.4$ .

Page 70.  $\log \tan 8^\circ 33' 00'' = 9.17708$  Tabular difference = 86  
                   proportional part for 10 = 14.3  
                   " " " 7 = 10.0  
 $\frac{1}{10}$  " " " 4 = .57  
 $\log \tan 8^\circ 33' 17''.4 = 9.17733.$

*Example 7.* Find  $\log \cot 56^\circ 43' 24''.7$ .

Page 95.  $\log \cot 56^\circ 43' 00'' = 9.81721$  Tabular difference = 28.  
                   proportional part for 20 = 9.3  
                   " " " 4 = 1.9  
 $\frac{1}{10}$  " " " 7 = .33  
 $\log \cot 56^\circ 43' 24''.7 = 9.81709.$

When the logarithm of a trigonometric function is given, the angle may be found by reversing the above operations.

*Example 8.* Given,  $\log \tan x = 9.87258$ . Find  $x$ .

In the column of logarithmic tangents on page 98, we find  $\log \tan 36^\circ 42' = 9.87238$ , with the tabular difference 26. The difference between this logarithm and the given one is 20. The proportional table for 26 gives

                  proportional part for 40 = 17.3  
                   " " " 6 = 2.6  
 $\frac{1}{10}$  " " " 2 = .09  
 consequently " " " 46.2 = 19.99, or very nearly 20.

Hence the number of seconds is 46.2, and the required angle is  $36^\circ 42' 46''.2$ .

When a very small angle is to be found by means of its logarithmic sine or tangent, and accuracy is desired, the arithmetical complement of S or T, pp. 2-21, should be used. These are given in the columns headed C S and C T, pp. 62-64. The formulas for their use are as follows:

$$\begin{aligned}\log \text{arc} &= \log \sin + \text{C S}, \\ \log \text{arc} &= \log \tan + \text{C T},\end{aligned}$$

the angle being expressed in seconds of arc. The value of C S or C T to be used in any case, is that which corresponds to the angle.

*Example 9.* Given,  $\log \sin x = 6.82973$ . Find  $x$ .

The value of  $x$ , (see p. 62), lies between  $0^\circ 2'$  and  $0^\circ 3'$ , or between  $120''$  and  $180''$ , and, corresponding to this,

$$\begin{aligned}\text{C S} &= 5.31443 \\ \log \sin x &= 6.82973 \\ \log \text{arc} &= 2.14416.\end{aligned}$$

The number corresponding to the logarithm 2.14416 is, (p. 4), 139.368. Therefore,  $x = 139''.368 = 0^\circ 2' 19''.368$ .

It is sometimes required to find the logarithm of one trigonometric function from that of another, without requiring the angle. To facilitate this, special proportional tables, headed with the tabular differences of both functions, are given, (pp. 71-106), wherever the space admits it.

*Example 10.* Given,  $\log \tan x = 9.67644$ . Required  $\log \cos x$ .

The difference between the given logarithm and that given in the table, 9.67622, (see p. 87, opposite  $25^\circ 23'$ ), is 22. The tabular differences of the two logarithmic functions at this place are 32 and 6. In the proportional table for  $\frac{1}{2}$ , 22 corresponds to 4; this, subtracted from the tabular logarithmic cosine 9.95591, gives the required  $\log \cos x = 9.95587$ .

In the examples already given, the angles have all been less than  $90^\circ$ . The logarithms of trigonometric functions of angles greater than  $90^\circ$  may be obtained by remembering the relations given in the following table:

Angle	Sine	Cosine	Tangent	Cotangent
$x$	$+\sin x$	$+\cos x$	$+\tan x$	$+\cot x$
$90^\circ + x$	$+\cos x$	$-\sin x$	$-\cot x$	$-\tan x$
$180^\circ + x$	$-\sin x$	$-\cos x$	$+\tan x$	$+\cot x$
$270^\circ + x$	$-\cos x$	$+\sin x$	$-\cot x$	$-\tan x$

For angles greater than  $90^\circ$ , the degrees are given at the tops and bottoms of the pages in smaller type. Where these have been obtained from the acute angle on the same page, by adding  $90^\circ$  or  $270^\circ$ , they are preceded by a \*. This indicates that the co-function is to be taken. Otherwise, the direct function is to be taken. The algebraic signs of the functions, as indicated by the above table, must be attended to.

*Example 11.* Find  $\log \sin 112^\circ 15' 17''$ .

Page 84.  $\log \sin 112^\circ 15' 00'' = 9.96640$  Tabular difference = 6  
 proportional part for  $17'' = 2$ , nearly,  
 $\log \sin 112^\circ 15' 17'' = 9.96638$ .

From the same page,  $\log \tan 202^\circ 28' 34'' = 9.61671$ ,  $\log \cos 202^\circ 28' 34'' = 9.96569$ ,  $\log \cot 292^\circ 18' 37'' = 9.61314$ .

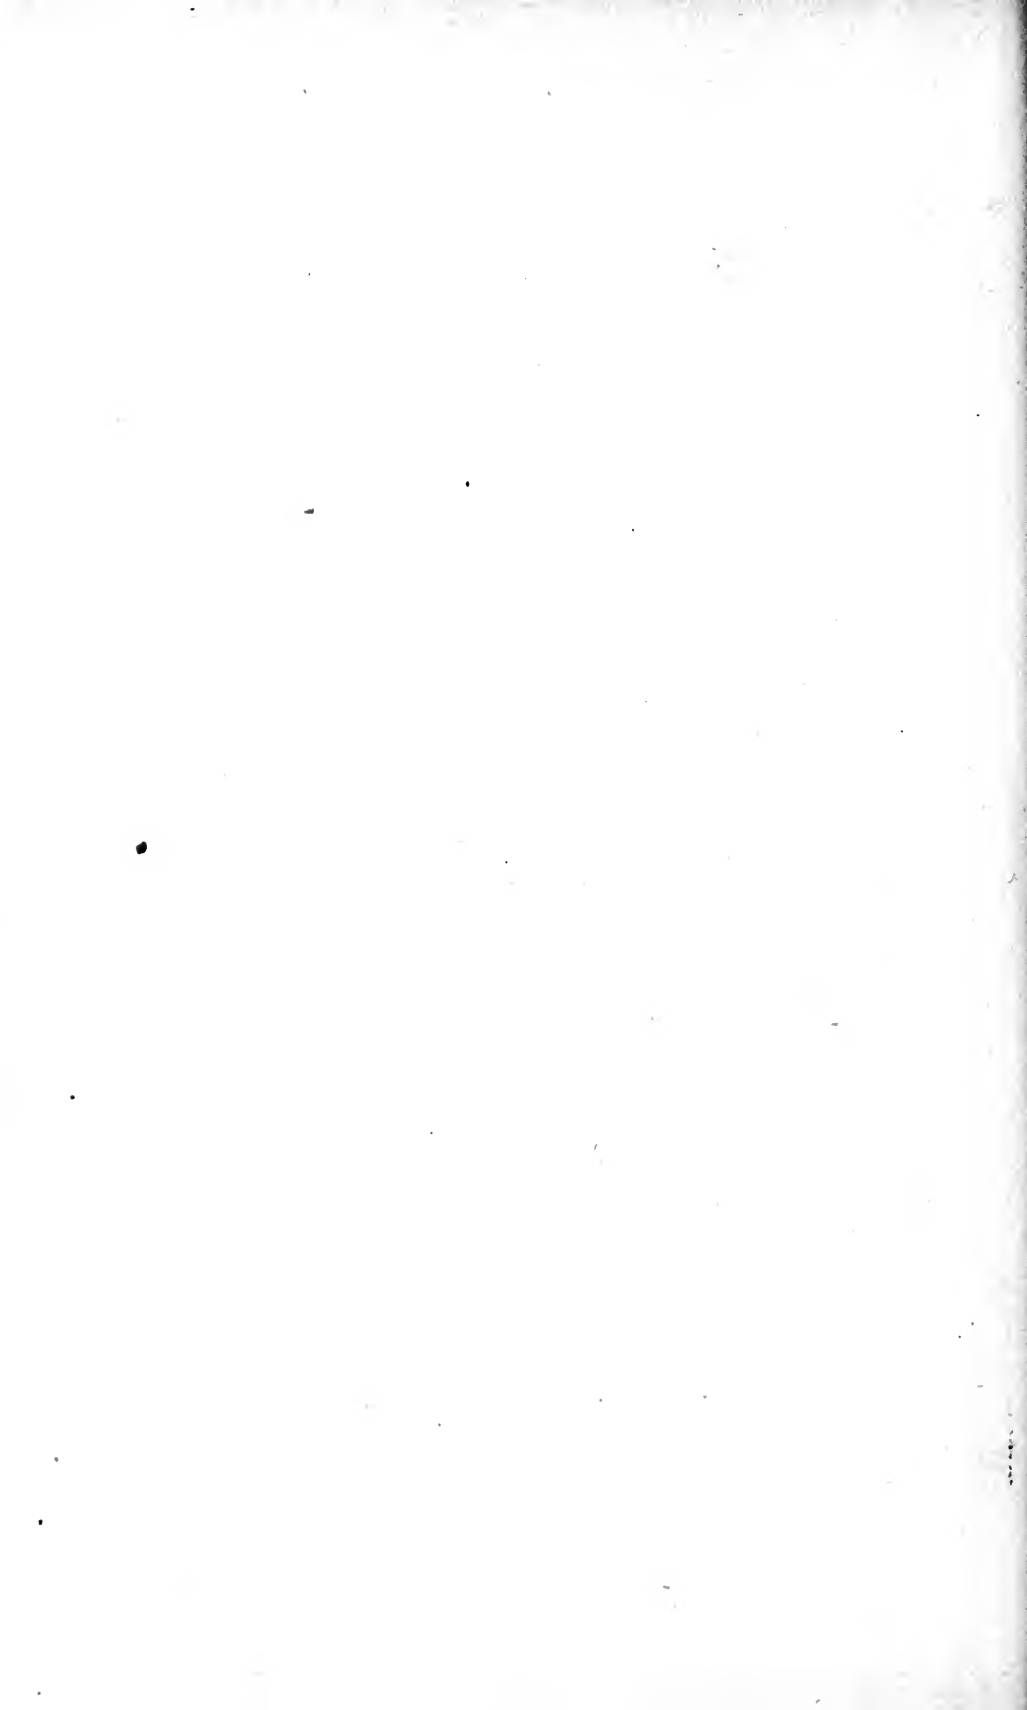

In the last two examples the \* following the logarithm indicates that the trigonometric function is negative. This is the usual way of indicating that the number corresponding to a logarithm is negative.

TABLE V.

Pages 108-130 contain the natural trigonometric functions for each minute. The arrangement is the same as that of the logarithms of the trigonometric functions, pp. 62-106, except that differences and proportional parts are not given.

TABLE VI, ETC.

Pages 131-139 contain the squares, cubes, square roots and cube roots of numbers from 1 to 1020. The arrangement of this table, and also of the ones which follow it, will be understood by inspecting them.

 $a > b,$ 
 $A = \log a - \log b,$ 
 $\log(a+b) = \log a + B.$ 

The above table of Addition Logarithms is based on the identity

$$\begin{aligned}\log(a+b) &= \log a \left(1 + \frac{b}{a}\right) \\ &= \log a + \log \left(1 + \frac{1}{\frac{a}{b}}\right).\end{aligned}$$

The argument  $A$  is  $\log \frac{a}{b}$ , and the function  $B$  is  $\log \left(1 + \frac{1}{\frac{a}{b}}\right)$ , conse-

quently

$$\log(a+b) = \log a + B.$$

$$a > b, \quad A = \log a - \log b, \quad \log(a-b) = \log a - B.$$

$$\text{or} \quad B = \log a - \log b, \quad \log(a-b) = \log a - A.$$

The above table of Subtraction Logarithms is based on the identity

$$\log(a-b) = \log\left(\frac{a}{x-1}\right) = \log a - \log\left(\frac{x}{x-1}\right),$$

where  $x = \frac{a}{b}$ .

The argument is  $\log x$ , and the function is  $\log\left(\frac{x}{x-1}\right)$ .

$A$  is the argument and  $B$  the function when  $\log x > .3$ , and

$B$  is the argument and  $A$  the function when  $\log x < .3$ .
